Abstract ID# 3955

Immigration policy is a social determinant of Latino health

- Population health surveys have not captured Latinos' direct experiences with immigration policy
- Research has focused on Latino populations' fears and perceptions of immigration policies
- Latino populations in rural areas are generally not included in national-level surveys, even though rural areas are often more politically conservative on immigration policy issues and contain predominantly non-Hispanic communities.

Community Health Survey

- As part of the Policies Influencing Rural Latino Health Study, we conducted a population-based survey from June 2024 to December 2024 of 3,108 Latinos residing in rural census tracts in 14 counties in California and Arizona, to understand their immigration policy experiences and health outcomes

- Latinos who live in rural areas have interacted with immigration enforcement policies or policies that enforce their legal status or rights
- It is feasible to survey Latinos about their diverse multi-generational health care access and immigration policy experiences
